PROJECT CASE STUDY · REVIEWED OCTOBER 14, 2026

Multi-Site Follow-up

Zahidul Islam · Client automation engineering

Current delivered scope

Client automation connecting JotForm, n8n, Google Sheets and Twilio for site-specific lead intake, welcome messages and scheduled follow-ups. October 11 repairs require matched provider acceptance before updating sent-state and preserve prior stage markers; explicit opt-outs revoke marketing consent, and all-failed batches continue to the next site. A credential-free six-request behavioral flow verified exactly three updates, and all three workflows matched local structure. Provider acceptance is distinct from delivery; no new paid message was sent during those repairs. The older Google Doc predates these local release records.

A rejected or ambiguous provider response can incorrectly mark a contact as sent.

Required valid matched provider acceptance, preserved stage markers and refused ambiguous item linkage.

October 11 retained behavioral evidence verifies accepted updates and loop continuation without a paid send; acceptance does not establish delivery.

An opted-out contact can remain eligible for later campaign stages.

Revoked marketing consent on explicit opt-out while preserving prior sent history and site isolation.

The current source and retained regressions distinguish accepted, opted-out, failed and unpaired outcomes.

Evidence: October 11 local release records and current source. The older Google Doc describes the earlier baseline. No new paid message or present live-health claim.
